

The task goal is to reduce the waste of pet products

We are focused on technological solution that would enable the users to share excess pet food and accessories piled in our homes.

This solution may be of use to private individuals, animal shelters, foundations, shops selling pet supplies etc.

A user who has excess food/accessories can declare it in the application by providing information about the type of product, the quantity, expiry date, location and so on at the tool designer's discretion.

A user in need of support states what products they need by providing information on the type, size, quantity and others – all at the tool designer's discretion.

In the next steps, interested persons can make a reservation and determine the method of transfer of goods.

There are options of putting the items up for a fee or free of charge.

In addition, you can implement into the system the possibility of ratings and comments for individual users.

You may plan the way of promotion of the solution with the indication of recipients and promotional means.
